

CP3 (C2): criterion-dependence at $\beta=0.13$ — trend & hazard structure are criterion-robust

median lifetime DECREASES with N under every criterion
(C2 'inversion' is criterion-robust, not a detector artifact)

$k > 1$ + rise-then-saturate robust under ρ_{std} criteria
mean-coh dip = censoring artifact (twisted collapses); corrected $k > 1$
